

Nearly 10 million Americans have hearing problems resulting from

living and/or working in noise-polluted environments. Experts estimate that 20 million

Americans are regularly exposed to noise that can result in hearing loss. The activities in

this booklet are designed to be used by teachers with children in grades three through six.

They may be adapted easily for use with older and younger students. Several are helpful in

building awareness in children of the importance of hearing conservation and the problem

of noise-induced hearing loss. Others may be used to introduce and reinforce scientific

understanding of hearing and the science of sound. Still others are meant to provide

opportunities for children to influence the awareness and understanding of others. All of

the activities have been used successfully in classroom settings.
